

With the introduction several years ago of Hyperion System 9, as well as the more recent release of Oracle Hyperion Enterprise Performance Management 11 Fusion Edition, it has become increasingly apparent that migrations to the latest releases involve proper planning, testing and execution. Applications must be carefully migrated to the new releases, and the server environments must be reviewed to ensure that they are sufficient to handle the expected load on the newest version. ITI Consulting has migrated many clients to these newer versions, and we help clients properly perform their migrations in the following ways:

Technical Components:

- Providing new environment architecture design and product installation.
- Performing system stress testing in the new environment.
- Creating disaster and recovery documentation and testing.

Application Components:

- Converting the applications.
- Performing historical data reconciliation.
- Implementing new functionality.
- Developing training materials and delivering end user training.
- Providing testing phase support (including user acceptance testing and parallel tests.)

ITI helps clients not only to migrate to the latest release, but also to take advantage of the latest functionality in that release, including HFM Phased Submissions, improved consolidation times in HFM, Workspace integration and the expanded suite of FDM adapters.
